README

Dataset Source

This project uses the **Inside Airbnb** listings dataset for New Zealand. The dataset contains information about Airbnb listings, including listing details, host information, location, pricing, availability, and guest reviews.

Dataset: all listings.csv datasets from Oct 2025 to June 2026

The data was downloaded from the Inside Airbnb project, which provides publicly available Airbnb data for research and analysis.

Scrape Date: 22th of June 2026

Dataset Columns

Column	Description	Cleaning Decision and Reasoning
id	Unique identifier for each Airbnb listing	Keep
name	Title of the Airbnb listing	Remove (Descriptive inconsistent information)
host_id	Unique identifier for the host	keep
host_name	Name of the host	Remove (Descriptive inconsistent information)
neighbourhood_group	District or territorial authority where the listing is located	Keep, useful for spatial analysis
neighbourhood	Local ward or neighbourhood of the listing	Keep, useful for spatial analysis
latitude	Latitude coordinate of the listing	Keep, required for spatial analysis
longitude	Longitude coordinate of the listing	Keep, required for spatial analysis
room_type	Type of accommodation (Entire home/apartment, Private room, Shared room, or Hotel room)	Keep, required for room availability analysis
price	Nightly rental price (NZD)	Keep, required for spatial and room availability analysis
minimum_nights	Minimum number of nights required for a booking	Keep, useful for room availability analysis
number_of_reviews	Total number of reviews received by the listing	Remove (irrelevant information for further analysis)
last_review	Date of the most recent guest review	Remove (irrelevant information for further analysis)

Column	Description	Cleaning Decision and Reasoning
reviews_per_month	Average number of reviews received per month	Remove (irrelevant information for further analysis)
calculated_host_listings_count	Number of active listings managed by the same host	keep, maybe useful for room availability analysis
availability_365	Number of days the listing is available for booking during the next 365 days	Keep, useful for room availability analysis
number_of_reviews_ltm	Number of reviews received during the last 12 months	Remove (irrelevant information for further analysis)
license	Registration or licence number	Remove (Missing Data)
data_month	Month of AirBnB listing	Keep, useful for room availability analysis
data_year	Year of AirBnB listing	Keep, useful for room availability analysis

N.B.:

- Each row represents a single Airbnb listing.
- Missing values occur in columns last_review, reviews_per_month, and license.

DUPLICATE MANAGEMENT: We have produced two versions of the Cleaned AirBnB dataset. We have applied the above mentioned column cleaning decisions to the dataset. Thereafter, cleaned the data set for duplicate listing entries and one without.

Duplicates retention: all duplicate listing entries are kept post column cleaning.

Rationale: Gives us multiple periods of information, a gradient of information (i.e. price fluctuations and room availability)

Duplicate removal: Post column cleaning, only keeping the latest listing entries and removing the oldest entries.

Rationale: Latest listing entry will have the most relevant information
